

TIME · VALUE · POTENTIAL

Your business can do *much more.*

Start from the problem people feel. Make the system visible. Build only what releases capacity.

STRUCTURE · INTEGRATE · HAND OVER

— The real issue

The work moves. The system around it slows it down.

The visible problem is often only the symptom. The constraint sits between people, tools and decisions.

01
WHAT YOU SEE

Delays · duplicate work · waiting

02
WHAT BLOCKS

Dependency · interface · decision

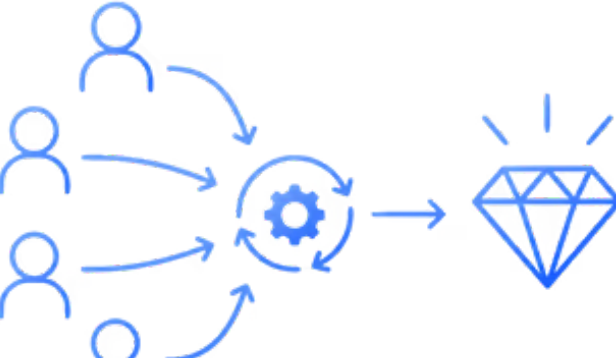

03
WHAT IS LOST

Time · value · potential

Three realities. One principle: start with the real constraint.

The message changes with your context. The method always starts with whatever prevents capacity from flowing.

01	Small business	02	SME	03	Industry · Deeptech
	TIME Win back time for your craft.		VALUE Grow value without multiplying layers.		POTENTIAL Unlock potential. Remove the constraints on growth.

TIME

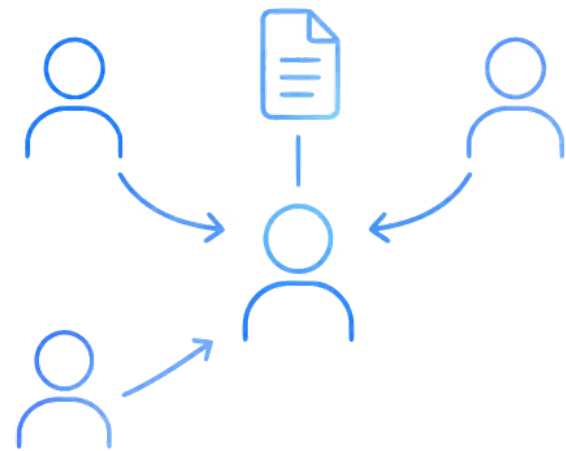

Your time should return to the work that matters.

Win back time for your craft.

When every request, decision or piece of information comes back to you, every new client also adds more workload.

What you may already be experiencing

01

Everything comes back to you.

Requests, decisions and follow-ups wait for your availability.

02

Repetitive work fills the day.

Data entry, checks and tracking replace time spent on the craft.

03

Tools impose workarounds.

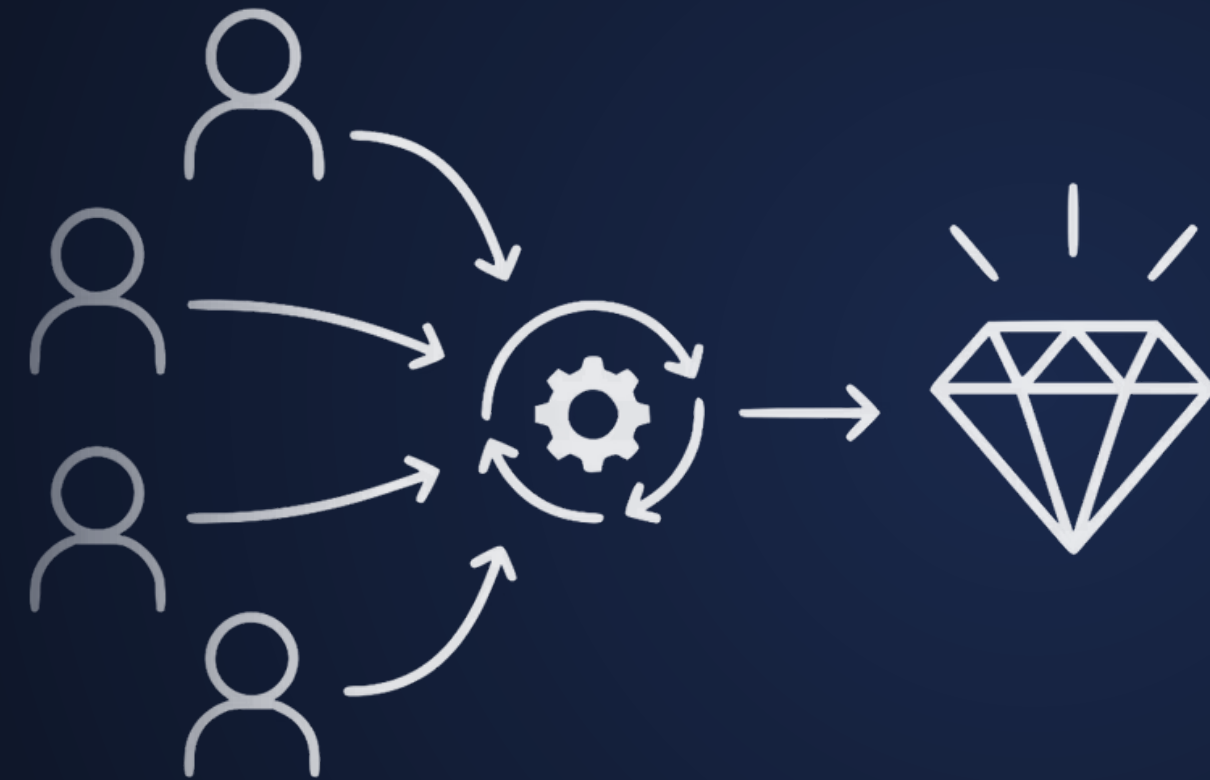

You adapt your way of working to solutions that do not fit your business.

VALUE

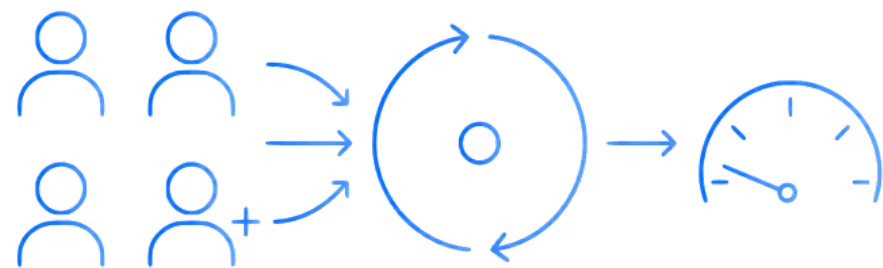

Growth should create capacity.

Grow value without multiplying layers.

When tools, meetings and coordination grow faster than delivery capacity, growth turns into layers.

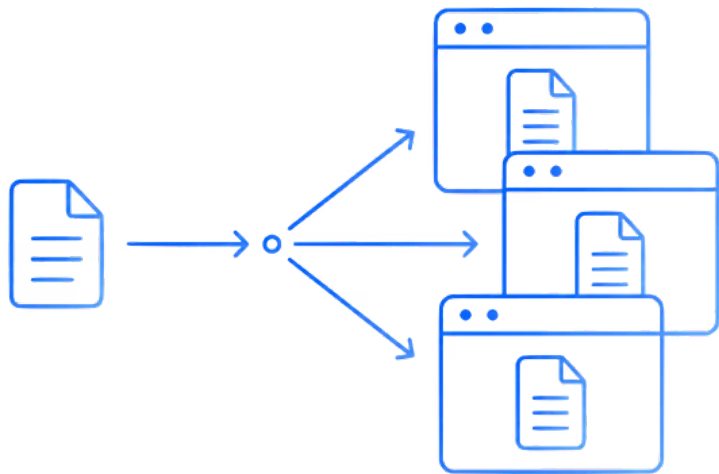

What you may already be experiencing

01

You hired, but did not accelerate.

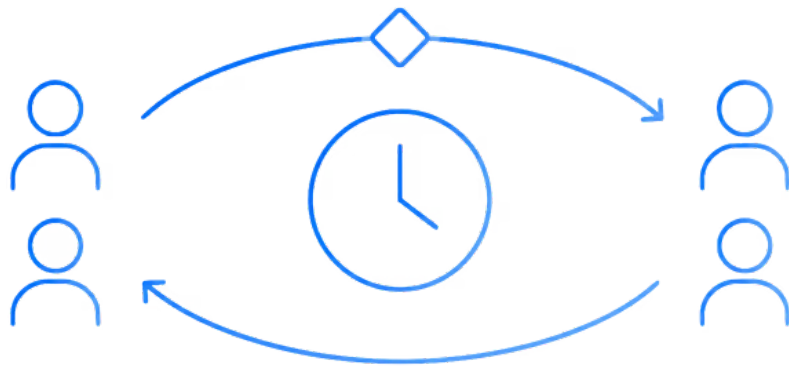

Coordination absorbs part of the capacity you just created.

02

Tools keep stacking up.

Information fragments and the same work reappears in several places.

03

Decisions do not flow.

More lead time is spent between teams than in the work itself.

POTENTIAL

Interfaces should no longer hold back execution.

Unlock potential. Remove the constraints on growth.

In an industrial or Deeptech system, constraints often sit between disciplines, decisions, approvals and evidence.

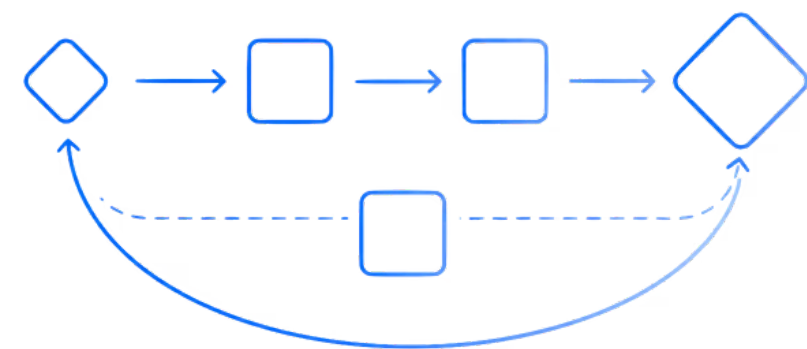

What you may already be experiencing

01

Interfaces cost more than tasks.

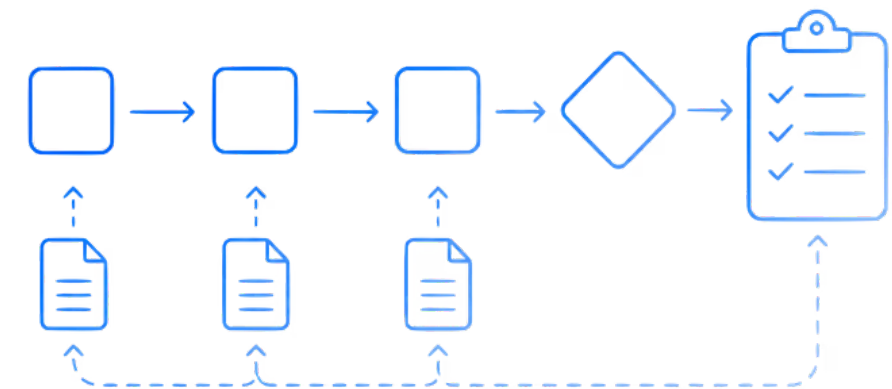

Each team moves forward, while the system waits between responsibilities.

02

Dependencies appear too late.

A local choice reveals its impact when reversing it has already become costly.

03

Validation comes at the end.

Evidence and constraints are rebuilt when the product should already be moving.

— The framing

Start from the real constraint.

We do not choose a tool first. We follow one real case to the point where time, value or potential is lost.

01

Follow

One real case, from request to result.

02

→ Locate

Waiting, rework and dependencies.

03

→ Quantify

What the constraint consumes or delays.

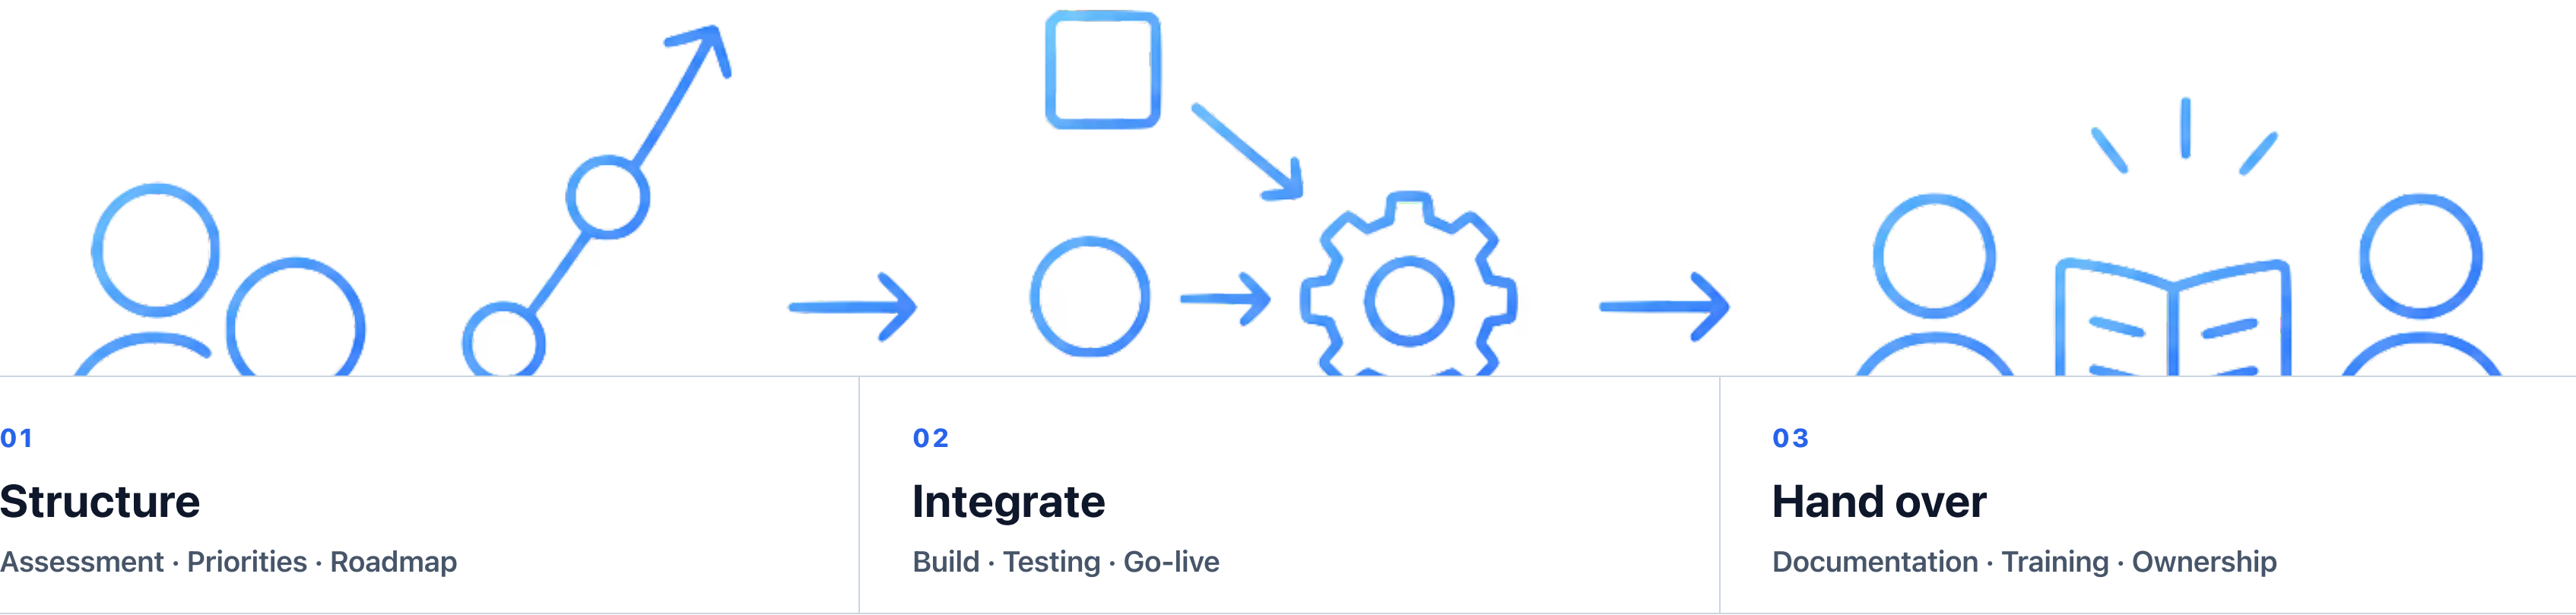

04

→ Decide

A useful roadmap, or a stop.

Understand before building.

Build for a clean handover.

Integration and Handover are optional: they are decided after the assessment.

A decision, not a promise.

The assessment makes the system visible, estimates the gains and turns the issue into a prioritised roadmap.

01 Continue
The gain justifies a build.

02 Reprioritise
Another constraint deserves attention first.

03 Stop
The issue does not justify further work.

SYSTEM SHEET

● Ready to test

From request to delivery

Input	Client request and business rules
Rule	Check data and capacity before work starts
Output	A complete, traceable and archived file
Safeguard	Nothing starts without human approval

The system takes over the repeatable steps. Your team keeps the decisions that require judgement.

— What you keep

You keep the keys.

The engagement should reduce dependency, not move it elsewhere.

01

A readable system

Explicit rules, tests and documentation that make the system understandable and transferable.

02

Your assets under control

Code, accounts, keys and data stay with you or on infrastructure you choose.

03

A clean handover

Training, a takeover guide and ownership: your team can continue with or without Intellarys.

— Client proof · EasyOpto

From a single provider to a system brought back under control.

Four people. Three training organisations. One critical CRM and mobile application.

BEFORE

Every change took over a month. The mobile application was blocked and the signing key was lost.

AFTER

The applications run from EasyOpto's own repository. The director tests and deploys without an intermediary.

The same three axes, made concrete.

TIME ≈ 1 month ahead of the planned schedule	VALUE Recurring costs divided by 5 durably	POTENTIAL Billing unblocked an operational bottleneck removed
---	---	--

- 100% of the code owned, by contract
- 1 → 20 tests with continuous integration
- Deployment without an intermediary

Results observed during the EasyOpto engagement · 2026

About Intellarys

The same person understands the need, builds the system and organises the handover.

Intellarys connects framing, construction and handover, with no translation layer between leadership and technology.

Sylvain Andlauer

Founder and independent systems architect

Intellarys Ingénierie

01 A systems architect, not an extra pair of hands

I look at how technology, organisation, contracts and people interact, rather than treating one layer in isolation.

02 Strategic and hands-on across disciplines

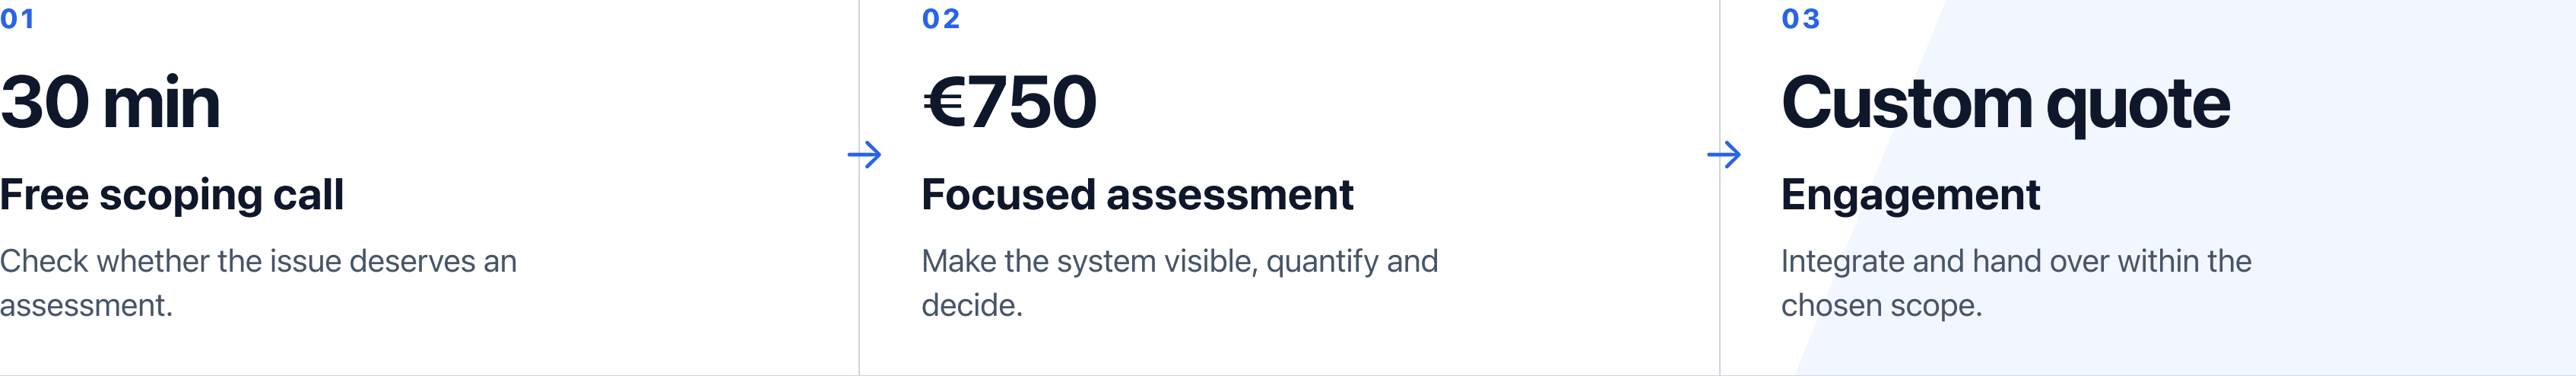

The same person works with your leadership and your technical team. Nothing is lost in translation.

03 Independent by design

No software vendor, product quota, technology partnership or hidden margin. Nothing to push.

Start with one real case.

A small scope. A clear decision. A build only when it is useful.

— Time · Value · Potential

Describe the symptom. I will look for the system behind it.

The right moment: a critical process depends on one tool, provider or person.
